W26000

沉水式噴射曝氣泵浦 JET PUMP APPLICATION

Features :

A jet pump device that creates velocity when a liquid is forced through an enclosed line which creates a partial vacuum. The air is then sucked in and mixes with the liquid and is ejected with which high pressure creates micro bubbles for highly dissolved oxygenated water while simultaneously delivering full aeration.

Usage:

1. Oxygenated for aquaculture, such as fishing farming or shrimp farming or hydroponics applications.
2. Oxygen aeration of wastewater for wastewater treatment.
